PROFILE

Software engineer who ships end-to-end. In just over a year, I've taken an app from a mere scaffold to being live on iOS and Android as its sole engineer, built AI pipelines from scratch and fixed reliability gaps across a production SaaS backend, working the full stack across mobile, backend, cloud, and AI. I care as much about product direction and the user's experience as I do about the code, and I love turning ambiguous problems into practical solutions.

WORK EXPERIENCE

Full Stack Software Engineer *May 2026 - Present*

Nexivity

- **Fixed** backups silently losing data under Cisco's API rate limits by diffing the SDK's source to find the regression, measuring the old system's real behaviour, and restoring it with a single concurrency gate.
- **Built** a "what changed?" comparison between any two network backups across four services, arguing for Lambda over Fargate on measured start-up costs, so typical organisations get results in under 4 seconds.
- **Rebuilt** the report customers see after restoring a network, tracing every outcome path in code to fix misreported results and adding filterable summaries, with each engine change verified by a live restore.
- **Designed** per-organisation licensing across 7 repos with DynamoDB, Stripe and a daily compliance job.

Software Engineer & Product Lead *Dec 2025 - Aug 2026*

Done Life

- **Rebuilt** the entire app from scratch one month into the role after identifying the no-code stack as a blocker, using AI dev tools to ship a working prototype in a single day that outperformed a year of prior work.
- **Made** the app 97% faster for users by replacing blind 15-minute polling with an event-driven mailhook pipeline, cutting average processing time for every inbound email from 20 minutes to 40 seconds.
- **Owned** monetisation end to end: paywalls, fail-closed entitlements and founder pricing on both stores.
- **Cut** cloud costs by 91% by building a junk filter that discards 90% of useless data before it hits the server.

Software Engineer Intern *Jun 2024 - Dec 2024*

Accenture

- **Fixed** a 1-2 day bottleneck of manually provisioning permission changes by building an automated API that resolved requests in 10 seconds using AWS Step Functions, Lambda, API Gateway & OpenSearch.
- **Automated** infrastructure provisioning with CloudFormation & Azure DevOps, cutting manual setup 80%.
- **Saved** the team 15+ hours monthly by automating repetitive operational tasks with AWS Lambda.
- **Improved** internal monitoring tools and real-time dashboards, keeping client-facing uptime at 100%.

Casual Academic *Feb 2024 - Present*

University of Sydney

- **Taught** machine learning to 530+ students across engineering disciplines, most with no coding background, in classes of up to 160, earning 95% positive feedback on anonymous surveys I run voluntarily each semester.

EDUCATION

Bachelor of Engineering Honours (Software Engineering) *Aug 2021 - July 2025*

University of Sydney

- Awarded **First Class Honours** with **79.2** Honours WAM & **76.8** WAM
- Received the Sydney International Student Award & Engineering Sydney Industry Placement Scholarship
- **Key Courses:** Intelligent Video Signal Understanding (91, HD), Cloud Computing (88, HD), Full Stack (86, HD)

TECHNICAL SKILLS

- **Languages & Frameworks:** Python, TypeScript, JavaScript, Dart, Java, Flutter, Next.js, React, Node.js
- **Cloud & Infrastructure:** AWS (Lambda, ECS Fargate, DynamoDB, S3, Cognito), GCP, Firebase, Terraform
- **AI & Tooling:** AWS Certified AI Practitioner, OpenAI Responses API, LLM evals, Claude Code, GitHub Actions
